Burkina Faso Exploration Drilling Results

AIM Resources Limited ("AIM Resources") wishes to advise that it has received analytical results for the exploration drilling program carried out at Perkoa and surrounding exploration permits (Poa and Guido) in August 2007.

The drilling program was designed to test 6 airborne Electromagnetic (EM) anomalies which were comparable to the EM signature expressed over the Perkoa deposit. Due to heavy seasonal rainfall at the time of drilling, high water levels impeded access to 2 of these anomalies and drilling was postponed pending the outcome of subsequent geophysical surveys over the region.

A total of 9 holes were drilled, totalling 2,402 meters, which targeted geophysical and geochemical anomalies. Four holes (A2-S1, I16-S1, I16-S2 and S10-S4) intersected visible sulphides (pyrite and pyrrhotite).

From the 4 EM anomalies drill tested, a total of 402 samples were collected and dispatched to ALS Laboratories in November 2007 for analysis. Notwithstanding visible sulphides, assay results for zinc, copper, lead, nickel and gold did not show significant grades.

In the intervening period, a VTEM airborne survey was completed over the Perkoa deposit and surrounding exploration permits. The data collected is currently being analysed and interpreted. AIM Resources is eager to present results from this survey, as VTEM is renowned for its capability of deep penetration and ability to detect EM anomalies at depths up to 800 meters. The data will be reviewed in light of results from the drilling program to determine if further follow up work is warranted.
